

UNITED STATES DEPARTMENT OF COMMERCE Patent and Trademark Office

Address: COMMISSIONER OF PATENTS AND TRADEMARKS Washington, D.C. 20231

FIRST NAMED INVENTOR SERIAL NUMBER FILING DATE 08/405,454 03/15/95 SULLIVAN EXAMINER CHWADRUN. F 18N1/1051 PAPER NUMBER > FINNEGAN HENDERSON FARABOW GARRETT AND DUNNER 1300 I STREET NW WASHINGTON DC 20005-3315 1816 DATE MAILED: This is a communication from the examiner in charge of your application. COMMISSIONER OF PATENTS AND TRADEMARKS This action is made final This application has been examined Responsive to communication filed on days from the date of this letter. A shortened statutory period for response to this action is set to expire Failure to respond within the period for response will cause the application to become abandoned. 35 U.S.C. 133 Part I THE FOLLOWING ATTACHMENT(S) ARE PART OF THIS ACTION: Notice of References Cited by Examiner, PTO-892. Notice of Draftsman's Patent Drawing Review, PTO-948. Notice of Informal Patent Application, PTO-152. 3. Notice of Art Cited by Applicant, PTO-1449. Information on How to Effect Drawing Changes, PTO-1474. Part II SUMMARY OF ACTION Of the above, claims 30-36 2. Claims have been cancelled. 3. Claims 5. Claims are subject to restriction or election requirement. 6. Ciaims 7. This application has been filed with informal drawings under 37 C.F.R. 1.85 which are acceptable for examination purposes. 8. Formal drawings are required in response to this Office action. . Under 37 C.F.R. 1.84 these drawings 9. The corrected or substitute drawings have been received on are acceptable; not acceptable (see explanation or Notice of Draftsman's Patent Drawing Review, PTO-948). _. has (have) been approved by the 10. The proposed additional or substitute sheet(s) of drawings, filed on examiner; disapproved by the examiner (see explanation). ____, has been approved; disapproved (see explanation). 11. The proposed drawing correction, filed _ 12. Acknowledgement is made of the claim for priority under 35 U.S.C. 119. The certified copy has been received not been received __ ; filed on _ been filed in parent application, serial no. _ 13. Since this application apppears to be in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11; 453 O.G. 213. 14. Other

Art Unit 1816

- 15. Claims 27,29,37-39 are under consideration. Claims 30-36 have been cancelled.
- 16. Applicants need to update the status of all US patent applications (eg. abandoned, etc.) disclosed in the specification (eg. 08/277,288 on page 1).
- 17. The following is a quotation of the first paragraph of 35 U.S.C. § 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The specification is objected to under 35 U.S.C. § 112, first paragraph, because the specification as originally filed, does not provide support for the invention as now claimed.

There is no support in the application as originally filed for the recitation in amended claims 27 and 29 that the antivenin composition is "essentially free from extraneous protein".

- 18. Claims 27,29,37-39 are rejected under 35 U.S.C. § 112, first paragraph, for the reasons set forth in the objection to the specification.
- 19. Claims 27,29,37-39 rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 39 is indefinite in that it lacks antecedent basis in claim 27. Claim 27 reads on a composition containing F(ab)

Art Unit 1816

fragments while claim 39 reads on an intact IgG(T)molecule which is not present in the F(ab) composition of claim 27. Claims 27 and 29 are indefinite in the recitation of a "composition comprising" because the additional ingredients which define a composition (eg. buffer, pharmaceutically acceptable carrier, etc.) are not recited in the claim. Claims 27 and 29 are indefinite in the recitation of "extraneous protein" because it is unclear what this means or encompasses. Claim 29 is indefinite in the recitation of "polyvalent F(ab) because it is unclear what this means or encompasses. F(ab) fragments are monovalent. It appears that applicants intend to refer to F(ab) fragments derived from polyvalent (eg. polyclonal) antisera. Applicants need to amend the claim using language supported in the specification.

20. The following is a quotation of the appropriate paragraphs of 35 U.S.C. § 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

21. Claim 29 is rejected under 35 U.S.C. § 102(b) as being clearly anticipated by Coulter et al. as evidenced by Stedman's Medical Dictionary (1977).

Coulter et al. teaches a composition of F(ab) fragments of antibody against textilotoxin (a snake toxin) (see pages 201-203). Stedman's Medical Dictionary defines antivenin as "an antitoxin specific for an animal or insect toxin" (page 94). Therefore the composition taught by Coulter et al. is an antivenin. The F(ab) composition (page 201, third paragraph) was derived from polyclonal

Art Unit 1816

antisera against textilotoxin (page 199, second paragraph). The F(ab) produced by said method were free of Fc and extraneous protein (see Abstract).

22. The following is a quotation of 35 U.S.C. § 103 which forms the basis for all obviousness rejections set forth in this Office action:

A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Subject matter developed by another person, which qualifies as prior art only under subsection (f) or (g) of section 102 of this title, shall not preclude patentability under this section where the subject matter and the claimed invention were, at the time the invention was made, owned by the same person or subject to an obligation of assignment to the same person.

23. Claims 27,29,37-39 are rejected under 35 U.S.C. § 103 as being unpatentable over Sullivan et al. in view of Coulter et al. and Smith et al. as evidenced by Stedman's Medical Dictionary (1977).

The claims are drawn to antivenin compositions consisting of F(ab) fragments. Sullivan et al. teach purified antivenin polyvalent antibodies derived from horse hyperimmune antisera against venom of the Crotalus genus (see Methods section, pages 185-187). These antibodies are predominantly IgG(T), because that is the predominant isotype found in hyperimmune horse antisera. A routineer would have used the procedure of Sullivan et al. to produce purified antivenin antibodies against any desired venom. A routineer would have immunized horses to produce said hyperimmune

Serial No. 08/405454

Art Unit 1816

antisera because this is the art recognized procedure for producing antivenin. Sullivan et al. do not teach a F(ab) containing antivenin.

Coulter et al. teaches a method for producing F(ab) fragments that are free of Fc (see abstract). Coulter et al. teaches a composition of F(ab) fragments of antibody against textilotoxin (a snake toxin) (see pages 201-203). Stedman's Medical Dictionary defines antivenin as "an antitoxin specific for an animal or insect toxin" (page 94). Therefore the composition taught by Coulter et al. is an antivenin. The F(ab) composition (page 201, third paragraph) was derived from polyclonal antisera against textilotoxin (page 199, second paragraph). The F(ab) produced by said method were free of Fc and extraneous protein (see Abstract). A routineer would have assayed for Fc by immunoelectrophoresis using anti-Fc antibodies or any other art recognized procedure.

Smith et al. teaches the advantages of F(ab) fragments for the neutralization and clearance of toxic substances in therapeutic applications (see page 393, first paragraph, Discussion section). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to have produced consisting of F(ab) fragments because antivenin compositions Sullivan et al. teach purified antivenin polyvalent antibodies derived from horse hyperimmune antisera against venom of the Crotalus genus, a routineer would have used the procedure of Sullivan et al. to produce purified antivenin antibodies against any desired venom, Coulter et al. teaches a method for producing antivenin F(ab) fragments that are free of Fc, and Smith et al. teaches the advantages of F(ab) fragments for the neutralization and clearance of toxic substances in therapeutic applications. One of ordinary skill in the art would have been motivated to do the aforementioned because Smith et al. teaches that,

Serial No. 08/405454

Art Unit 1816

"Relatively rapid clearance of Fab fragments can be used to advantage when the objective is rapid neutralization and clearance of a toxic substance, and purified sheep digoxin specific Fab fragments have been utilized clinically for the reversal of advanced digoxin intoxication. This therapeutic approach is based similar binding properties and the postulated on immunogenicity of Fab compared with IgG. For urgent clinical situations such as life threatening digitalis-toxic cardiac arrhythmias, the present study indicates that Fab has another important advantage-more rapid and extensive distribution to its presumed site of action in the interstitial space." (page 393). Further motivation is provided by the teaching of Coulter et al. that F(ab) antivenin can be made and that said antivenin work in vivo to neutralize snake toxins (see page 202, third paragraph). In addition, Sullivan et al. teach that reducing the immunogenicity of polyvalent horse antivenin is an important goal, due to immune the clinical efficacy of limit that reactions preparations which contain only partially purified hyperimmune horse antisera (see page 185, first paragraph).

Applicants arguments in the amendment received 1/17/95 have been considered and deemed not persuasive. Regarding the various hypothetical scenarios in the Smith declaration (pages 2 and 3) as to why F(ab) fragments would not be expected to neutralize snake venom in vivo (which are repeated in pages 4-9 of the amendment received 1/17/95), Coulter et al. teaches that F(ab) antivenin can neutralize snake toxin in vivo as effectively as IgG (see page 202, third paragraph). With regards to the clinical study depicted in paragraphs 12 and 13 of the Smith declaration, there is no disclosure in the specification of TAb001, or a F(ab) fragment containing antisera against Vipera berus. Regarding applicants comments about on page 7 of the amendment received 1/17/95, neither F(ab) or intact IgG have any effect on alpha-amanitin poisoning, so

Serial No. 08/405454

Art Unit 1816

that this point is irrelevant to the discussion at hand. Regarding applicants comments on page 8, Coulter et al. teaches that F(ab) antivenin can neutralize snake toxin in vivo as effectively as IgG (see page 202, third paragraph). Regarding the alleged unexpected results disclosed in the Smith declaration (page 9-10 of the amendment received 1/17/95), there is no disclosure in the specification of TAb001, or a F(ab) fragment containing antisera berus. Regarding applicants comments against Vipera nonobviousness and long-felt need, Coulter et al. teaches that F(ab) antivenin can neutralize snake toxin in vivo as effectively as IgG (see page 202, third paragraph).

- 24. Papers related to this application may be submitted to Group 180 by facsimile transmission. The faxing of such papers must conform with the notice published in the Official Gazette, 1096 OG 30 (November 15, 1989). Papers should be faxed to Group 180 at (703) 305-7401.
- 25. Any inquiry concerning this communication or earlier communications from the Examiner should be directed to Dr. Ron Schwadron whose telephone number is (703) 308-4680. The examiner can normally be reached Tuesday through Friday from 8:30 to 6:00. The examiner can also be reached on alternative Mondays. A message may be left on the examiners voice mail service. If attempts to reach the examiner by telephone are unsuccessful, the Examiner's supervisor, Ms Margaret Moskowitz Parr can be reached on (703) 308-2454. Any inquiry of a general nature or relating to the status of this application should be directed to the Group 180 receptionist whose telephone number is (703) 308-0196.
